Ma. Kim Antonette C. Gepilano
9 - Argon

Output of number 7 and 8:

```
PS C:\Users\gemma\AppData\Local\Programs\Microsoft VS Code> & C:\Users\
8
8
Hello, Student! Welcome to VS Code.
```

```
Hello, Student! Welcome to VS Code.
PS C:\Users\gemma\AppData\Local\Programs\Microsoft VS Code> & C:\Users\gemma\AppDa
25
20
Hello, Ma. Kim Antonette C. Gepilano! Welcome to VS Code.
PS C:\Users\gemma\AppData\Local\Programs\Microsoft VS Code>
```

Tasks:

a.) Syntax Highlighting

- Syntax highlighting improves readability because functions, variables, and strings have different colors, which makes it easier for the user to know which line has an error.

b.) Code Completion

```
PS C:\Users\gemma\AppData\Local\Programs\Microsoft VS Code> & C:\User
Traceback (most recent call last):
  File "c:\Users\gemma\OneDrive\Desktop\GRADE 9_CS3\main.py", line 18
    main(add_)
         ^^^^
NameError: name 'add_' is not defined
```

- IntelliSense of VSCode reduces typing effort because it predicts what the user is planning to code next. It also prevents errors by highlighting them, so the user can identify and change the code immediately.

c.) Debugging Tools

main.py

C: > Users > gemma > OneDrive > Desktop > GRADE 9_CS3 > main.py > main

```
1   # math_utils.py
2
3   def add_numbers (a, b):
4       return a+b
5
6   def multiply_numbers (a, b):
7       return a*b
8
9   def greet_user (name):
10      return f"Hello, {name}! Welcome to VS Code."
11
12  def main():
13      print(add_numbers(5, 20))
14      print(multiply_numbers(4, 5))
15      print(greet_user("Ma. Kim Antonette C. Gepilano"))
16
17  if __name__=="__main__":
18      main()
```

- I will receive information about the code step by step, depending on the commands I choose. For instance, I will click step-over; it runs the current code and pauses on the next line of code. This will help me understand and analyze a specific line of code; the same goes for other commands even though they work differently.

d.) Error Detections

- VS Code indicates errors by outlining the line with a red squiggly line. This helps me notice and verify it before running the code so that errors will be prevented.

Reflection Questions:

a.) Personally, I think VS Code is much more complex than IDLE Python because it has more features. They also have similar features, and both are helpful to users; however, users tend to use VS Code since it does not only contain Python but also other computer programming languages (e.g., C++, Java, etc.), and it is also beginner-friendly. For Python, it has debugging features, but it's very basic compared to VS Code. Nevertheless, both are helpful for users to code.

b.) Based on the tasks above, IntelliSense and Error Squiggles help users catch mistakes. For example, if you make obvious mistakes, it will show a red highlight or red line underneath the code, which alarms the user to verify their code immediately.
